

Extension Routing

THIS WIKI HAS BEEN UPDATED FOR VERSION 13 OF YOUR PBX GUI

Commercial Module

Extension Routing allows you to easily and visually control which extensions are allowed to use specific outbound routes.

Normally, to block extensions from using an outbound route, you either have to create a custom context for each extension you want to modify, or do the tedious work of creating custom dial plans. This method is slow. It is NOT easily replicated or checked for errors and omissions. It is not easily configured by novice users.

With the Extension Routing module, you can easily view which extensions are able to use specified routes and make changes by dragging and dropping extensions. You can customize your dial plan to enable or disable extensions with a swipe of a mouse.

Want to set up a public area phone that can dial local or internal numbers, but block it from making costly long distance or international calls? Want to completely block employees from your international routes if they don't need international calling? You can do this with the Extension Routing module.

Note

If you have the [Class of Service \(CoS\)](#) module installed and enabled, you will need to use that module to manage route access.

— Allowed Routes

Check/Uncheck All Routes ?	<input type="checkbox"/>
E911-Leave-First ?	<input checked="" type="checkbox"/>
Local ?	<input checked="" type="checkbox"/>
Long Distance ?	<input type="checkbox"/>
International ?	<input type="checkbox"/>
Information ?	<input checked="" type="checkbox"/>

Extension Routing ?

Allowed Extensions

4100 (John Doe)
4101 (Jane Doe)
