

# Version 14.0 Installation

FreePBX Version 14.0 Supports Asterisk 11 as minimum.

If you want to use FreePBX commercial modules, you must install FreePBX on SNG7, using [the FreePBX Distro ISO](#). FreePBX itself is open source, and can be installed on any modern Unix-based distribution that supports PHP 5.6 or higher.

## *Supported/Tested \*nix Distributions*

Distribution	Date Last Tested	Certified	Tested	Commercial Module Support	Notes
<a href="#">CentOS 7</a>	01 May 2017	No	Yes	No	No commercial module support
<a href="#">Debian 8.8</a>	06 Jan 2017	No		No	100% Open Source installation
<a href="#">Ubuntu 18.04</a>		No		No	100% Open Source installation

To reduce download and install time, please be aware that of these instructions give you a **minimal** install. This is enough to provide for basic PABX functionality, but you should go to Module Admin, and select 'Check Online' to download the additional modules after installation. There are approximately 50 additional modules that can be installed.
